

Proven Technology to Improve or Keep Your Leapfrog Hospital Safety Grade

Healthcare systems must focus on myriad quality measures to achieve maximal patient safety and quality care goals. How a healthcare system performs in these measures impacts its ratings from Federal Agencies and consumer public service resources. Without the use of technology tools; understanding, prioritizing and managing the factors that support quality and safety across all measures is likely unattainable.

Healthcare systems that have taken advantage of comprehensive rounding, insights and workflow software achieve better performance by discovering and addressing opportunities for improvement. The identification of these pain points allows hospitals to craft action plans to improve their patient safety record and save lives.

How Safe is Your Hospital
